The synchronizing panel includes indications of voltage, angle, and slip that show what adjustments the operator needs to make to the governor and exciter and when it is acceptable for the operator to close the breaker. In many cases, the process is automated using an automatic synchronizer with manual control available as a Fundamentals and Advancements

If LED is in too slow region then we need to raise governor speed and vice versa. The guy first raises speed manually and then put in auto mode which makes DG frequency same as grid frequency by slowing down governor. I hope you are cleared. when the speed of the Turbo-Generator (TG) reaches to 95% of its rated speed. The synchronization can be done by the Main Control Room (MCR) panels or Generator control panel (GCP) as per the operator choice. The Operator selects MAN synchronization from a two state switch called AUTO/MAN synchronization.
